About This Guide

This document guides the user on enabling a popular subset of [Murata's Wi-Fi/Bluetooth modules](#) (1YN, 1LV, 2AE, 1XA, 1MW, 1DX) on Embedded Artists' [iMX8M Mini Developer's Kit V3](#). All Murata Wi-Fi/Bluetooth modules are designed into [Embedded Artists' M.2 modules](#). As such, the exercise of enabling various Murata modules is a simple matter of plug 'n play.

Audience & Purpose

This document is intended as an introduction for end users to start evaluating Murata Wi-Fi/Bluetooth solutions for Linux on Embedded Artists' i.MX platforms.

Document Conventions

Table 1 describes the document conventions used in this guide.

Table 1: Document Conventions

Conventions	Description
	Warning Note Indicates very important note. Users are strongly recommended to review.
	Info Note Intended for informational purposes. Users should review.
	Menu Reference Indicates menu navigation instructions. Example: Insert → Tables → Quick Tables → Save Selection to Gallery 
	External Hyperlink This symbol indicates a hyperlink to an external document or website. Example: Embedded Artists AB  Click on the text to open the external link.
	Internal Hyperlink This symbol indicates a hyperlink within the document. Example: Introduction  Click on the text to open the link.
<code>Console input/output or code snippet</code>	Console I/O or Code Snippet This text Style denotes console input/output or a code snippet.
<code># Console I/O comment // Code snippet comment</code>	Console I/O or Code Snippet Comment This text Style denotes a console input/output or code snippet comment. <ul style="list-style-type: none"> Console I/O comment (preceded by "#") is for informational purposes only and does not denote actual console input/output. Code Snippet comment (preceded by "//") may exist in the original code.

1 Introduction

This Quick Start Guide details enabling a selection of Infineon based [Murata's Wi-Fi/Bluetooth modules](#) specifically on the [Embedded Artists' iMX8M Mini Developer's Kit V3](#) (running Linux 5.10.72). The Embedded Artists' M.2 modules in this document covers:

- Type 1YN (CYW43439)
- Type 1LV (CYW43012)
- Type 2AE (CYW4373E)
- Type 1XA (CYW54591)
- Type 1MW (CYW43455)
- Type 1DX (CYW4343W)

The Embedded Artists' Developer's Kits / COM boards currently supported are based on i.MX 8, i.MX 7 and i.MX 6. All platforms have direct M.2 interconnect with following signals supported:

- WLAN-SDIO, WLAN-PCIe
- BT-UART, BT-PCM
- WLAN/BT control signals
- WLAN JTAG and WLAN/BT debug signals

Examples of hardware/software configurations are illustrated to introduce users to the Murata wireless solution and demonstrate the ease of getting started with Embedded Artists' hardware/software. **Figure 1** shows the Embedded Artists' hardware platform with one of the M.2 modules (2AE).

Figure 1: Embedded Artists' iMX8M Mini Developer's Kit V3 with Type 2AE M.2 Module

The Wi-Fi/Bluetooth M.2 interconnect on this Developer Kit is optimized to provide comprehensive signaling for all necessary bus interfaces (WLAN-SDIO, WLAN-PCIe, WLAN-USB, BT-UART, BT-PCM, WLAN and Bluetooth control signals). Embedded Artists document their platform extensively [at this link](#) – select “Resources” tab. In particular, users are encouraged to reference [Embedded Artists' Getting Started with M.2 modules and i.MX6/7/8 on Linux v5.10](#). In addition, Murata provides the following document detailing Infineon based solutions: [Murata Wi-Fi/BT \(CYW\) Solution for i.MX Linux User Guide](#).

The following sections describe the process of getting Wi-Fi and Bluetooth up and running on [Embedded Artists' iMX8M Mini Developer's Kit V3](#) with [Embedded Artists' M.2 Module based on Murata Wi-Fi/Bluetooth](#), running [Embedded Artists' Linux 5.10.72 kernel release](#). This document also describes the process of easily switching between Embedded Artists' M.2 modules without any need for complicated hardware changes or software builds.

Note that Wi-Fi/Bluetooth M.2 EVB (Evaluation Board) is equivalent to Wi-Fi/Bluetooth M.2 module. We use “EVB” sometimes to better distinguish the M.2 form factor from the actual Murata module.

2 Interfacing the Wi-Fi/Bluetooth M.2 Module (EVB)

Figure 2 and **Figure 3** illustrate how Embedded Artists' M.2 module is connected to their iMX8M Mini Developer's Kit V3 in the M.2 slot. No additional cabling is required.

Figure 2: Plug in the M.2 module at a shallow angle, inserting it fully into M.2 Connector

Figure 3: Continue pushing with finger (for snug fit) while securing M.2 module with screw

3 Download Prebuilt Linux Image and Flash Platform

Embedded Artists provide prebuilt Linux images for users to quickly download and flash the i.MX platforms. These are available at Embedded Artists [i.MX Related Resources Page](#). The following steps showcase the process of downloading and flashing the image for the Linux kernel 5.10.72. The host system being used is running Windows® 10. For detailed information from Embedded Artists, please refer to [Embedded Artists' Getting Started with M.2 modules and i.MX6/7/8 on Linux v5.10](#).

- Download the 5.10.72 Linux image for Embedded Artists' iMX8M Mini Developer's Kit V3 from Embedded Artists [i.MX Related Resources Page](#) as shown in **Figure 4**. The correct title of the download is "uuu_imx8mm_ucom_5.10.72.zip (release notes)".
- Extract the downloaded archive. This will extract both the image as well as the UUU application that can be used to flash the board.
- Set up the Developer's Kit and the console by following the online [Getting Started](#).
- Put the Developer's Kit into OTG mode to download the image, by closing the JP10 jumper as shown in **Figure 5**.

Ensure that no Windows application (such as VMware Workstation) which may interfere with the USB device instantiation is running. The Embedded Artists Dev Kit's onboard eMMC flash is configured as a USB interface during this step.

- Power on the Developer's Kit.
- Open a command prompt, navigate to the folder where the downloaded zip file was extracted and run the UUU tool.

```
C:\> cd c:\temp\uuu_imx8mm_ucom_5.10.72
C:\temp\uuu_imx8mm_ucom_5.10.72> uuu.exe full_tar.uuu
```

- The terminal will show the download progress as shown in **Figure 6**.
- Wait till the download is complete as shown in **Figure 7**.
- Power off the Developer's Kit.
- Put the Developer's Kit into eMMC boot mode, by opening the JP10 jumper.
- Power on and boot the Developer's Kit.
 - Username: root
 - Password: pass

4 Connectivity Options

The modular design of Embedded Artists' Developer's Kits and the industry standard M.2 interface of the Murata Wi-Fi/BT modules allow users to quickly switch wireless solutions. Specifically, the Embedded Artists' solution makes switching wireless solutions quite simple by merely running the "switch_module.sh" script. This feature is consistent with Embedded Artists' overall approach to their hardware/software solutions: lowering the bar for customers so they can quickly get their desired software applications up and running.

4.1 Murata Wi-Fi/Bluetooth Modules

Supported Infineon-based Wi-Fi/Bluetooth modules include Type 1YN, Type 1LV and Type 2AE.

- Ensure the Developer's Kit is powered off and connect the Type 1YN M.2 module.
- Power on and boot the Developer's Kit. Issue the following commands to enable the Type 1YN module and reboot the platform.

```
$ switch_module.sh 1yn
$ switch_module.sh off
$ reboot
```

- The Developer's Kit should boot with and bring up Type 1YN's WLAN interface automatically.

To setup the Developer's Kit for working with the Type 2AE module, follow the same procedure outlined above.

- If powered, issue the "halt" command, and power off the Developer's Kit

```
$ halt
```

- Unscrew and disconnect the Type 1YN M.2 module from the Developer's Kit and connect the Type 2AE M.2 module.
- Set up the Developer's Kit for working with the Type 2AE module, by invoking the "switch_module.sh script" and rebooting the platform as shown below.

```
switch_module.sh 2ae
switch_module.sh off
reboot
```

- The Developer's Kit should boot with and bring up Type 2AE's WLAN interface automatically.

Sections [4.1.1](#) and [4.1.2](#) provide more details on configuring and exercising Wi-Fi and Bluetooth, including console log output. Similarly, "switch_module.sh" script can be used to enable any of the bundled M.2 modules (see [Section 6](#)). The table below shows the switch_module commands for enabling the different Murata modules.

Table 2: switch_module Commands

Module	switch_module.sh Command
Type 1YN	switch_module.sh 1yn
Type 1LV	switch_module.sh 1lv
Type 2AE	switch_module.sh 2ae
Type 1XA	switch_module.sh 1xa
Type 1MW	switch_module.sh 1mw
Type 1DX	switch_module.sh 1dx

4.1.1 Enable Wi-Fi

This section details steps for bringing up Wi-Fi on Infineon-based Wi-Fi/Bluetooth M.2 modules. For Infineon-based devices, the WLAN device name is **wlan0**. The logs shown below are for Type 2AE module.

- Enable 2AE module with the following two “switch_module.sh” commands.

```
root@imx8mmea-ucm:~# switch_module.sh 2ae
DTB_VER is v3

Setting up for 1DX, 1LV, 1MW, 1WZ, 1YN, 2AE (Cypress - SDIO)
Please wait for 15 seconds (one-time only)...
Disabling mlan0
Enabling wlan0
Created symlink /etc/systemd/system/multi-
user.target.wants/wpa_supplicant@wlan0.service ->
/lib/systemd/system/wpa_supplicant@wlan0.service.
Setup complete.

root@imx8mmea-ucm:~# switch_module.sh off
DTB_VER is v3
Disabling mlan0
Disabling wlan0
Removed /etc/systemd/system/multi-
user.target.wants/wpa_supplicant@wlan0.service.
```

- Issue the “reboot” command.

```
$ reboot
```

- After rebooting and logging in (username: “root”; password: “pass”), check to see if the interface is up.

```
# WLAN MAC address can be seen as Hwaddr
# The UP flag indicates the mlan0 interface is up
root@imx8mmea-ucm:~# ifconfig wlan0
wlan0      Link encap:Ethernet  HWaddr 10:A5:D0:99:27:3B
           UP BROADCAST MULTICAST  MTU:1500  Metric:1
           RX packets:0 errors:0 dropped:0 overruns:0 frame:0
           TX packets:0 errors:0 dropped:0 overruns:0 carrier:0
           collisions:0 txqueuelen:1000
           RX bytes:0 (0.0 B)  TX bytes:0 (0.0 B)
```

- Scan for available Wi-Fi networks.

```
$iw dev wlan0 scan
```

- Connect to an unsecured Access Point (AP) "Murata_5G".

```
root@imx8mmea-ucom:~# iw dev wlan0 connect Murata_5G
root@imx8mmea-ucom:~# [ 45.537898] IPv6: ADDRCONF(NETDEV_CHANGE):
wlan0: link becomes ready
$ iw dev wlan0 link
Connected to 84:1b:5e:f6:a7:60 (on wlan0)
    SSID: Murata_5G
    freq: 5180
    RX: 1944 bytes (8 packets)
    TX: 0 bytes (0 packets)
    signal: -44 dBm
    tx bitrate: 24.0 MBit/s
    bss flags:
    dtim period: 1
    beacon int: 100
```

- Run DHCP client to get IP address.

```
root@imx8mmea-ucom:~# udhcpc -i wlan0
udhcpc: started, v1.33.1
udhcpc: sending discover
udhcpc: sending select for 192.168.1.16
udhcpc: lease of 192.168.1.16 obtained, lease time 86400
/etc/udhcpc.d/50default: Adding DNS 192.168.1.1
```

- Ping AP (IP address 192.168.10.1) to check connectivity.

```
$ ping 192.168.10.1
```

4.1.2 Enable Bluetooth

This section includes the steps to bring up Bluetooth and scan for Bluetooth devices for IFX modules. The logs shown below are for Type 2AE module.

- Load the Bluetooth driver by issuing the following command. The Linux BlueZ stack is used for Bluetooth operations.

```
root@imx8mmea-ucom:~# /opt/ea/bluetooth_up.sh
bcm43xx_init
Set Controller UART speed to 3000000 bit/s
Flash firmware /etc/firmware/BCM4373A0.2AE.hcd
Set Controller UART speed to 3000000 bit/s
Setting TTY to N_HCI line discipline
Device setup complete
Scanning ...
    28:39:5E:24:FE:95      [AV] Samsung Soundbar K450 K-Series
    50:14:79:B8:2D:09      j755020
```
